Checklist for Auditors/Assessors

IoT Systems Certification Scheme STQC Directorate, MeitY, Government of India INDIA

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

Cl.No	Requirements as per 'ISO/IEC 27402 IoT security		liance	Status	Observation
	and privacy — Device baseline requirements	Yes	No	N/A	
5.1	Requirements for IoT device policies and				
	documentation				
5.1.1	Risk management				
5.1.1.1.1	IoT devices shall have documentation recording				
	the results of a risk assessment process performed				
	at the IoT device level in the context of a risk				
	assessment at the system level.				
5.1.1.1.2	The risk assessment process shall take into account				
	intended outcomes for the intended use case.				
5.1.1.1.3	The risk assessment process shall also take into				
	account the needs and expectations of interested				
	parties (e.g. those parties on networks to which				
	the IoT device is connected), including				
	physical and logical undesired effects.				
5.1.1.1.4	The risk assessment shall take into account that IoT				
	devices can be constrained (e.g. limited battery,				
	little memory, 'weak' CPU), which informs the risk				
	treatment process.				
5.1.1.1.5	Risk assessment and treatment processes shall be				
	defined and applied as follows:				
	a) determine if separate risk assessment and				
	treatment processes are necessary for different				
	products;				
	b) select appropriate risk treatment options, taking				
	account of the risk assessment results;				
	c) determine all controls that are necessary to				
	implement the risk treatment option(s) chosen;				
	d) identify all security and privacy features of the				
	IoT device from the controls identified in c) above;				
	e) compare the features identified in d) above with				
	those in 5.2, and verify that no necessary features				
	have been omitted;				
	f) produce a Statement of Applicability that				
	contains the necessary features [see steps d) and				
	e)] and justification for inclusions and the				
	justification for exclusions of features from 5.2;				

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

	g) if other standards related to device		
	requirements are used, implement the		
	requirements of those		
	standards after steps a) through to f);		
	h) formulate a risk treatment plan;		
	i) inform the risk owner of the risk treatment plan		
	and any residual risks, or where applicable, obtain		
	their approval of the plan and acceptance of the		
	residual risks.		
5.1.1.1.6	IoT devices shall implement the features and		
0.2.2.2.0	controls identified as necessary in its Statement of		
	Applicability, as well as features and controls		
	identified in 5.1.1.1.5, step g).		
5.1.1.1.7	The documentation shall be available for the		
	supported lifetime of the product.		
5.1.2	Information disclosure		
5.1.2.1.1	IoT devices shall have user documentation that		
	lists the features that the IoT device provides		
	to support controls for security and privacy,		
	making it clear if any of the IoT device		
	requirements in 5.2 are not included.		
5.1.2.1.2	Such information shall be publicly available for the		
	period of time the IoT device is supported.		
5.1.2.1.3	IoT devices shall be covered by a security support		
	policy and other supporting documentation		
	wherein users are made aware in advance of when		
	security updates will be discontinued.		
5.1.3	Vulnerability disclosure and handling processes		
5.1.3.1.1	IoT devices shall have documentation that defines		
	the vulnerability disclosure and handling processes		
	that will apply for the supported lifetime of the		
	device.		
5.1.3.1.2	Vulnerability disclosure and handling processes		
	shall include, at a minimum, a capability to receive		
	reports of potential vulnerabilities from the public.		
5.2	Requirements for IoT device capabilities and		
	operations		
5.2.1	General- This clause includes IoT device features		
	to be used with a risk assessment and treatment		
	process in accordance with 5.1.1.		

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

5.2.2	Configuration		
5.2.2.1.1	If the configuration settings of the IoT device can be modified, only authorized entities shall be able to modify the configuration settings of the IoT device.		
5.2.2.1.2	If IoT devices are capable of changing the configuration of IoT and other devices, they shall only be capable of making such changes when authorized.		
5.2.3	Software reset		
5.2.3.1.1	If IoT devices have the capability to be reset, that process shall be secure.		
5.2.3.1.2	This capability shall only be executable by an authorized entity.		
5.2.4	User data removal		
5.2.4.1.1	If the IoT device stores user data, it shall provide a function for deleting appropriate user data stored on the device in any type of memory.		
5.2.4.1.2	The function shall be restricted to authorized entities only.		
5.2.5	Protection of data		
5.2.5.1.1	IoT devices shall be capable of protecting the data they store and transmit from unauthorized access, modification and disclosure.		
5.2.5.1.2	This shall include configuration settings, identifying data, user data, event logs and sensitive security parameters.		
5.2.5.1.3	IoT devices shall be capable of protecting their software (including firmware) from unauthorized access and modification.		
5.2.5.1.4	IoT devices shall use cryptography (e.g. encryption with authentication, cryptographic hashes, digital signature validation) to prevent the confidentiality and integrity of data requiring protection from being compromised.		
5.2.5.2	Additional recommendation		
5.2.5.2.1	General When IoT devices are started up, they should check the integrity and authenticity of the software and/or firmware and enforce security controls. If the IoT		

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

	device fails these checks, it should:			
	— notify the user of any violation,			
	— render itself inoperable,			
	— operate in a fail-safe mode that provides security			
	protection, or			
	— initiate device recovery if recovery actions can			
	be performed with integrity.			
	Upon first installation or maintenance, IoT devices			
	should set themselves to secure default			
	configurations. User configuration options should			
	prevent users from choosing insecure			
	configurations or provide a warning.			
	If capable, IoT devices should have the ability to			
	provide compartmentalization.			
	IoT devices should use function modules to restrict			
	access to system resources, which should only be			
	granted to authorized entities.			
	Trusted computing bases (TCB) should be kept as			
	small as possible to minimize the surface that is			
	exposed to attackers and to reduce the probability			
	that a bug or feature can be used to circumvent			
	security protections.			
	Memory protection mechanisms such as memory			
	safe languages, stack canaries, address space layout			
	randomization (ASLR) and limited or no execute			
	permissions are recommended wherever applicable.			
5.2.5.2.2	Event logging			
	If capable, IoT devices should record sufficient			
	details for each event to facilitate an authorized			
	entity's ability to identify anomalous events and			
	meaningfully analyse the associated data.			
5.2.5.2.3	Sensitive security parameters			
	The outcome of the risk assessment in 5.1.1 should			
	help determine whether an IoT device may include			
	hard-coded or shared sensitive security parameters,			
	if such parameters are unique per device and not			
	universal.			
5.2.5.3	Additional information			
5.2.5.3.1	General			
	Hardware-based solutions such as built-in			
	crypto accelerators and dedicated hardware can			
	enhance the use of cryptographic modules and			
	cryptographic key protection capabilities to			
	- Jr - GF F enpuenties to		1	

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

 enforced boundaries to prevent a flaw or breach in one software compartment from propagating to other software compartments in the system. Compartmentalization introduces additional protection boundaries within the hardware and software stack to create additional layers of defence in depth. For example, a common technique is to use operating systems processes or independent virtual machines as compartments. Integrity checking and recovery modes may not be appropriate in safety critical applications where continuous operation is essential. 5.2.5.3.2 Event logging Implementation of event logging, including editing of logs, depends on device storage capabilities. IoT devices can support remote logging. 5.2.6 Interface access 5.2.6.1.1 IoT devices shall have mechanisms to limit logical access to its interfaces to authorized entities only. 5.2.6.1.2 IoT devices shall employ appropriate authentication 		protect the data in storage and transit to meet the performance requirements. Physical countermeasures can support resistance to side channel attacks. Such functions can include hardware-based root of trust (RoT). RoT is a foundational feature to provide platform integrity and ensure a foundation to develop and support the device's chain of trust. The root of trust is ideally based on a hardware-validated boot process to ensure the system can be started using code from an immutable source. As such, RoT is essential to enable platform attestation including for a verified boot process. When used to protect secrets and device correctness, hardware can support a foundational root of trust upon which rich software functionality can be implemented more securely and safely. Compartments are protected by hardware-		
compartments.Integrity checking and recovery modes may not be appropriate in safety critical applications where continuous operation is essential.Implementation of event logging, including editing of logs, depends on device storage capabilities. IoT devices can support remote logging.Implementation of event logging, including editing of logs, depends on device storage capabilities. []	IoT devices regarding creation and use of		
	identifiers.		
5.2.6.1.4	IoT devices shall ensure that common values for		
5.2.0.1.4			
	critical security parameters, such		
	as global private keys or standard passwords, are		
	replaced by values that are unique per device or		
	explicitly defined by an appropriate external entity		
	before they are put into operation.		
5.2.6.2	Additional recommendation(s)		
	The IoT device should be capable of being		
	logically identified. While identifiers can enable		
	a host of cybersecurity controls (such as asset		
	management, automatic device discovery, and		
	software updates), creating or using persistent		
	identifiers should be avoided unless such use is		
	unavoidable. Where such uses arise, the		
	existence of such identifiers should be made		
	clear to users.		
	Mechanisms to limit logical access (to authorized		
	entities) should be applied to the following:		
	a) the ability to enable or disable, through software or hardware means, any interfaces		
	(including local and network interfaces);		
	b) the ability to restrict access (e.g. through authentication) to all remote interfaces;		
	a) the chility to identify on block devices not		
	c) the ability to identify or block devices not		
	supported by an IoT device when it is attempting to access interfaces.		
5.2.6.3	Additional information		
5.2.6.3.1	General		
5.2.0.3.1			
	Examples of user interfaces include administrative		
	consoles, web pages, APIs or other externally-		
	exposed IoT device interfaces. Injection, XML		
	external entities, cross site scripting and insecure		
	deserialization are examples of common attacks to		
	remote interfaces.		
	Hardware-based capabilities can harden interface		
	access protection against privilege escalation and		
	control-flow attacks.		
5.2.6.3.2	Identifiers		

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

IoT devices can use identifiers in order to					
operate within an IoT system. Examples of					
such identifiers include serial numbers,					
cryptographic keys, and certificates.					
Software and firmware updates					
If the IoT device supports software updates, updates					
shall be performed using a secure procedure.

Checklist for Auditors/Assessors

IoTVS Level 1

IOTVS Level 1 requirements aim to provide a security baseline for connected devices which does not allow an attacker to move laterally to other devices or systems on the IoT ecosystem.

#	Description	Mapping with Requirements as per 'ISO/IEC 27402	Observation
C.1	Verify that application layer debugging interfaces such USB, UART, and other serial variants are disabled or protected by a complex password.	Interface access	
C.2	Verify that cryptographic keys and certificates are unique to each individual device.	Interface access	
C.3	Verify that memory protection controls such as ASLR and DEP are enabled by the embedded/IoT operating system, if applicable.	Protection of data	
C.4	Verify that on-chip debugging interfaces such as JTAG or SWD are disabled or that available protection mechanism is enabled and configured appropriately.	Interface access	
C.5	Verify that trusted execution is implemented and enabled, if available on the device SoC or CPU.	Protection of data	
C.6	Verify that sensitive data, private keys and certificates are stored securely in a Secure Element, TPM, TEE (Trusted Execution Environment), or protected using strong cryptography.	Protection of data	
C.7	Verify that the firmware apps protect data-in- transit using transport layer security.	Protection of data	
C.8	Verify that the firmware apps validate the digital signature of server connections.	Protection of data	
C.9	Verify that wireless communications are mutually authenticated.	Protection of data	
C.10	Verify that wireless communications are sent over an encrypted channel.	Protection of data	
C.11	Verify that any use of banned C functions are replaced with the appropriate safe equivalent functions.	General	
C.12	Verify that each firmware maintains a software bill of materials cataloging third-party components, versioning, and published vulnerabilities.	Vulnerability disclosure and handling processes	

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

C.13	Verify all code including third-party binaries, libraries, frameworks are reviewed for hardcoded credentials (backdoors).	General	
C.14	Verify that the application and firmware components are not susceptible to OS Command Injection by invoking shell command wrappers, scripts, or that security controls prevent OS Command Injection.	General	

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

Checklist for Auditors/Assessors

IoTVS Level 2

IoTVS Level 2 is for IoT devices that contain sensitive data, which requires protection and is the recommended level for most devices.

#	Description	Mapping with Requirements as per 'ISO/IEC 27402	Observation
C.1	Verify that application layer debugging interfaces such USB, UART, and other serial variants are disabled or protected by a complex password.	Interface access	
C.2	Verify that cryptographic keys and certificates are unique to each individual device.	Interface access	
C.3	Verify that memory protection controls such as ASLR and DEP are enabled by the embedded/IoT operating system, if applicable.	Protection of data	
C.4	Verify that on-chip debugging interfaces such as JTAG or SWD are disabled or that available protection mechanism is enabled and configured appropriately.	Interface access	
C.5	Verify that trusted execution is implemented and enabled, if available on the device SoC or CPU.	Protection of data	
C.6	Verify that sensitive data, private keys and certificates are stored securely in a Secure Element, TPM, TEE (Trusted Execution Environment), or protected using strong cryptography.	Protection of data	
C.7	Verify that the firmware apps protect data-in- transit using transport layer security.	Protection of data	
C.8	Verify that the firmware apps validate the digital signature of server connections.	Protection of data	
C.9	Verify that wireless communications are mutually authenticated.	Protection of data	
C.10	Verify that wireless communications are sent over an encrypted channel.	Protection of data	
C.11	Verify that any use of banned C functions are replaced with the appropriate safe equivalent functions.	General	
C.12	Verify that each firmware maintains a	Vulnerability disclosure and

	pseudo-random number generator on	
	embedded device (e.g., using chip-provided	
	random number generators).	
C.24	Verify that firmware can perform automatic	Software and firmware
	firmware updates upon a predefined	updates
	schedule.	

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

Checklist for Auditors/Assessors

IoTVS Level 3

IoTVS Level 3 is for the most critical IoT devices that perform high value transactions, contain sensitive medical data, or any application that requires the highest level of trust.

#	Description	Mapping with Requirements as per 'ISO/IEC 27402	Observation
C.1	Verify that application layer debugging interfaces such USB, UART, and other serial variants are disabled or protected by a complex password.	Interface access	
C.2	Verify that cryptographic keys and certificates are unique to each individual device.	Interface access	
C.3	Verify that memory protection controls such as ASLR and DEP are enabled by the embedded/IoT operating system, if applicable.	Protection of data	
C.4	Verify that on-chip debugging interfaces such as JTAG or SWD are disabled or that available protection mechanism is enabled and configured appropriately.	Interface access	
C.5	Verify that trusted execution is implemented and enabled, if available on the device SoC or CPU.	Protection of data	
C.6	Verify that sensitive data, private keys and certificates are stored securely in a Secure Element, TPM, TEE (Trusted Execution Environment), or protected using strong cryptography.	Protection of data	
C.7	Verify that the firmware apps protect data-in-transit using transport layer security.	Protection of data	
C.8	Verify that the firmware apps validate the digital signature of server connections.	Protection of data	
C.9	Verify that wireless communications are mutually authenticated.	Protection of data	
C.10	Verify that wireless communications are sent over an encrypted channel.	Protection of data	
C.11	Verify that any use of banned C functions are replaced with the appropriate safe equivalent functions.	General	
C.12	Verify that each firmware maintains a software bill of materials cataloging third-party components, versioning, and published vulnerabilities.	Vulnerability disclosure and handling processes	
C.13	Verify all code including third-party binaries, libraries, frameworks are reviewed for hardcoded credentials	General

	(backdoors).		
C.14	Verify that the application and firmware components are not susceptible to OS Command Injection by invoking shell command wrappers, scripts, or that security controls prevent OS Command Injection.	General	
C.15	Verify that the firmware apps pin the digital signature to a trusted server(s).	General	
C.16	Verify the presence of tamper resistance and/or tamper detection features.	General	
C.17	Verify that any available Intellectual Property protection technologies provided by the chip manufacturer are enabled.	General	
C.18	Verify security controls are in place to hinder firmware reverse engineering (e.g., removal of verbose debugging symbols).	General	
C.19	Verify the device validates the boot image signature before loading.	General	
C.20	Verify that the firmware update process is not vulnerable to time-of-check vs time-of-use attacks.	Software and firmware updates	
C.21	Verify the device uses code signing and validates firmware upgrade files before installing.	Software and firmware updates	
C.22	Verify that the device cannot be downgraded to old versions (anti-rollback) of valid firmware.	Software and firmware updates	
C.23	Verify usage of cryptographically secure pseudo- random number generator on embedded device (e.g., using chip-provided random number generators).	Protection of data	
C.24	Verify that firmware can perform automatic firmware updates upon a predefined schedule.	Software and firmware updates	
C.25	Verify that the device wipes firmware and sensitive data upon detection of tampering or receipt of invalid message.	User data removal	
C.26	Verify that only micro controllers that support disabling debugging interfaces (e.g. JTAG, SWD) are used.	Interface access	
C.27	Verify that only micro controllers that provide substantial protection from de-capping and side channel attacks are used.	Protection of data	
C.28	Verify that sensitive traces are not exposed to outer layers of the printed circuit board.	Interface access	
C.29	Verify that inter-chip communication is encrypted (e.g. Main board to daughter board communication).	Protection of data	

Document No. STQC/IoTSCS/F04, Issue No. 01 Issue Date: 15-12-2023

C.30	Verify the device uses code signing and validates code before execution.	Protection of data
C.31	Verify that sensitive information maintained in memory is overwritten with zeros as soon as it is no longer required.	User data removal
C.32	Verify that the firmware apps utilize kernel containers for isolation between apps.	General
C.33	Verify that secure compiler flags such as -fPIE, -fstack- protector-all, -WI,-z,noexecstack, -WI,-z,noexecheap are configured for firmware builds.	General
C.34	Verify that micro controllers are configured with code protection (if applicable).	Protection of data
